No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

                                                                                                                      The NBP46 root lectin is instrumental in recognising and binding to nitrogen fixing rhizobial bacteria via a lectin-carbohydrate interaction. The production of transgenic plants comprising an expression cassette expressing the NBP46 root lectin is advantageous since it would mean that non-leguminous plants could fix nitrogen from the atmosphere, lessening the need for the addition of nitrogen containing fertilizer to soil. This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively, replant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           introducing into a plant an expression cassette comprising a plant promoter operably linked to a heterologous LNP (lectin/nucleotide phosphohydrolase) polynucleotide, or its complement. The LNP's described in the invention are involved in binding a variety of carbohydrates, catalysing the dephosphorylation of nucleotide di- and tri-phosphates and are suspected to be involved in oligosaccharide signalling, important for the interaction of mycorrhizal fungi and plants. The method is useful to increase mycorrhizal infection (by increasing expression of the polynucleotide), resulting in increased uptake of nutrients by plants and better growth/development, but antisense (or other methods of) suppression of LNP expression is also contemplated. This sequence encodes the Lotus japonicus lectin/nucleotide phosphohydrloase (LNP) that can be used to modulate mycorrhizal infection in plants. (Updated on 29-AUG-2003

                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides the protein and coding sequences of a pea protein with nucleotide triphosphate decomposing activity. The gene can be used for conferring blight resistance on a plant. The present sequence is one version of the coding sequence of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for increasing or decreasing drug resistance in target bacteria, yeast, plant or mammalian cells by altering the ATP gradient across the biological membrane of the target cell. The method is useful for modulating drug resistance of cells. It is useful for increasing the sensitivity of cells to chemcheraputic and antibiotic agents and increasing resistance to herbicides. The present sequence is from Pisum sadivum and encodes an ecto-phosphatase (extracellular phosphatase). This sequence was used in the present invention to modulate drug resistance. Note: The present sequence is not shown in the specification, but is referred to via its GenBank accession number
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Increasing or decreasing drug resistance in target bacteria, yeast, plant or mammalian cells comprises altering ATP gradient across biological membrane of target cell.

                  ठ
                          The present invention provides the protein and coding seguences of a pea
protein with nucleotide triphosphate decomposing activity. The gene can
be used for conferring blight resistance on a plant. The present sequence
is one version of the coding sequence of the invention

The gene can be used for conferring blight resistance on a plant. The present sequence is one version of the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SerSerGlnTyrLeuGlyAsnAsnLeuLeuThrAsnArgLysIlePheGlnLysGlnGlu 44

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a method of modulating mycorrhizal infection by introducing into a plant an expression cassette Comprising a plant promoter operably linked to a heterologous LNP (lectin/nucleotide phosphotydrolase) polymucleotide, or its complement. The LNP's described in the invention are involved in binding a variety of carbohydrates, catalysing the dephosphorylation of nucleotide di- and tri-phosphates and are suspected to be involved in oligosaccharide signalling, important for the interaction of mycorrhizal fungi and plants. The method is useful to increase mycorrhizal infection (by increasing expression of the better growth/development, but antisense (or other methods of) suppression of LNP expression is also contemplated. This sequence encodes the Medicago sativa lectin/nucleotide phosphohydrloase (LNP) that can be used to modulate mycorrhizal infection in plants

Claim

σ

```
The production of transgenic plants comprising an expression caseette expressing the NBP46 root lectin is advantageous since it would mean that non-leguminous plants could fix nitrogen from the atmosphere, lessening the need for the addition of nitrogen containing fertilizer to soil This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively, the plant. The nucleic acid sequences can be used to modulate oligosaccharide signalling in the plant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene
                                                                                                                                                                                                                                                                                                                                                                                                          rhizobial bacteria via a lectin-carbohydrate interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     242 AspLeuTyrValHisSerTyrLeuArgPheGlyLysGluAlaThrArgAlaGlnValLeu 261

The invention describes a method of modulating mycorrhizal infection by introducing into a plant an expression cassette comprising a plant promoter operably linked to a heterologous LNP (lectin/nucleotide phosphorytoclase) polynucleotide, or its complement. The LNP's described in the invention are involved in binding a variety of carbohydrates, catalysing the dephosphorylation of nucleotide di- and tri-phosphates and are suspected to be involved in olingosaccharide signalling, important for the interaction of mycorrhizal fungi and plants. The method is useful to increase mycorrhizal infection (by increasing expression of the polynucleotide), resulting in increased uptake of nutrients by plants and better growth/development, but antisense (or other methods of) suppression of LNP expression is also contemplated. This sequence encodes the Dolichos biflorus lectin/nucleotide phosphohydrioase (LNP) that can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LysSerLeulleProLeuLeuGluGluAlaGluAspValValProGluAspLeuHisPro 121

The NBP46 root lectin is instrumental in recognising and binding to nitrogen fixing rhizobial bacteria via a lectin-carbohydrate interaction. The production of transpenic plants comprising an expression cassette expressing the NBP46 root lectin is advantageous since it would mean that non-leguminous plants could fix nitrogen from the atmosphere, lessening the need for the addition of nitrogen containing fertilizer to soil. This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively, the plant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene

The NBP46 root lectin is instrumental in recognising and binding to nitrogen fixing rhizobial bacteria via a lectin-carbohydrate interaction. The production of transgenic plants comprising an expression cassette expressing the NBP46 root lectin is advantageous since it would mean that non-leguminous plants could fix nitrogen from the atmosphere, lessening the need for the addition of nitrogen containing fertilizer to soil. This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively,

expression of NBP46 can be used to modulate oligosaccharide signalling in the plant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene expression. This DBX sequence also isolated from D. biflorus is also involved in oligosaccharide signalling
                                                                                                                                                                                                                                                                                          123

                                                                                                                                                                                                  Db
                                                                                                                                                                                                                                    ð
                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                            8
                                                                         the invention reactes to interioring a circumstance of the plant cell has been exposed, comprising: (a) contacting nucleic acid from representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the plant cell production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abject stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

The invention relates to a novel isolated polynucleic acid segment modulated within a cell by posttranscriptional gene silencing (PTGS). The invention specifically relates to a method to identify an expression product that is modulated by PTGS. The polynucleotide is useful for polynucleic acid into a cell and expressing the nucleic acid segment in the cell to form a product. The polynucleic acid segment is also useful for augmenting a cell and expressing the nucleic acid segment in for augmenting a plant cell with the segment to produce a transformed plant cell, and growing the transformed plant cell, to produce a differentiated transformed plant cell, and MEZ42017 - MEZ42142 represent segments of A. thaliana cDNA modulated by PTGS
                                                                                                                                                                                   Novel polynucleic acid segment useful for modulating within a cell by posttranscriptional gene silencing, plant cell genome.
                                                                                             Wang X,

The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. MI comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or yiral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GCTACTGCAGGTTTGAGGACGCTGGGTCATGATGCATCTGAGAACATTTTGCAAGCGGTT 510

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polymucleotides in the plant cell with an array or probes representative of the plant cell genome, and (b) detecting a profile of expressed polymucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence
                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     information supplied to Derwent by the Buropean Patent Office

/note="Vector: pBluescript SK-; Site_1: EcoRI; Site_2:
Xhol; cDNA was prepared from poly4+ enriched RNA from
roots harvested at 10, 17, 22, 31 and 38 days
post-inoculation with Glomus versiforme. The cDNA was
directionally ligated into the Unizap XR vector from
Stratagene and packaged using Giappeck III Gold packaging
extracts. Plasmids containing cDNA inserts were excised
from the recombinant lambda-Zap phage using Ex-assist
helper phage and propagated in XLOLR cells."

BI267324 651 bp mRNA linear EST 18-JUL-2001
NF105B12IN1F1101 Insect herbivory Medicago truncatula cDNA clone
NF105B12IN 5', mRNA sequence.
                                                                /note="Vector: pBluescript SK -; Site_1: EcoRI; Site_2:
Xho1; cDNA was prepared from polyA+ enriched RNA. The cDNA
was directionally ligated into the Unizap XR vector from
Stratagene and packaged using Gigapack III Gold packaging
extracts. Plasmids containing cDNA inserts were excised
from the recombinant lambda-Zap phage using Ex-assist
helper phage and propagated in XLOLR cells."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ThrTyrSerGlyValGluTyrLysAlaPheSerProSerSerGlySerAsnPheAspAsp 300

/note=TVECTOR: BBluescript SK-; Site 1: EcoRI; Site 2:
XhoI; CDNA was prepared from polyA+ enriched RNA. The cDNA
was directionally ligated into the Unizap XR vector from
Stratagene and packaged using Gigapack III Gold packaging
extracts. Plasmids containing cDNA inserts were excised
from the recombinant lambda-Zap phage using Ex-assist
helper phage and propagated in XLOLR cells."

/clone lib="Developing flower"
/note="Vector: Lambda Zap; cDNA was prepared from polyA-enriched, pooled samples of equivalent amounts of total RNA from very young, developing, fully-opened flowers and flowers transitioning into pods. The CDNA was forctor directionally ligated into the Uni-Zap XR vector (Stratagene) and packaged using the Gigapack III Gold packaging extracts. Phagemids containing cDNA inserts were in vivo excised from the recombinant Uni-Zap XR vector using ExAssist helper phage and the E. coli strain XLI-Blue MRR* (Stratagene). Excised plasmids were plated using SOLR cells."

/clone_lib="Developing flower"
/note="Wector: Lambda Zap; cDNA was prepared from polyA+enriched, pooled samples of equivalent amounts of total RNA from very young, developing, fully-opened flowers and flowers transitioning into pods. The cDNA was directionally ligated into the Uni_Zap XR vector (Stratagene) and packaged using the Gigapack III Gold packaging extracts. Phagemids containing cDNA inserts were using ExAssist helper phage and the B. coli strain XL-Blue MRF' (Stratagene). Excised plasmids were plated using SOLR cells."
